

Guidelines for Presentation

How will we Present?

You will present on the Projector, in front of the whole Lab group. You may use your OWN laptop to present. Just one laptop please, as there will not be enough time to change from one laptop to another. Please bring an adapter to VGA/HDMI, and ask the Lab In-Charge for help regarding connectivity of your laptop to the projector.

Who will attend/grade the Presentation?

The Presentations will be attended and graded by a panel of TAs and Instructors

How should we structure the Presentation?

This is just a guideline. Feel free to choose your own style, depending on the work you did. You will get 5 minutes followed by 5 minutes of Q&A (max 2 questions).

First 2 minutes of your presentation

- You **MUST** mention which dataset you worked on, and what **EXACTLY** was your objective.
- You may then want to **BRIEFLY** present your Exploratory Data Analysis and observations.
- If it is an ML project (regression/classification/clustering/anomaly), mention which one(s).
- You may now briefly clarify why and how the ML problem(s) aim(s) to solve your objective.

Next 3-4 minutes of your presentation

- Is the data already clean/structured for your ML problem? If not, how did you prepare the data?
- How did you apply the ML technique to solve your problem? Which models did you use? Why?
- Did you only use tools and techniques learned within the course? What else did you learn/try?

Last 2 minutes of your presentation

- What is the outcome of your project? Did you meet your initial objective? Anything interesting?
- You **MUST** conclude by clearly mentioning who in your team worked on which portion of work.

Everything mentioned above should be presented within the 8 minutes. You will be timed, so practice it!

You must present as a team, with everyone talking about some portion of the project. Any one member may surely lead the presentation, but everyone must contribute. In addition, you **MUST** mention at the end of the presentation who did which portion of the project. The presentation may be a combination of a PPT (slide) presentation, plus a Demonstration of your project on Jupyter Notebook or any other way. Slides are highly recommended, as it structures your flow. You may present from Jupyter/Dashboard too, but be organized.

Note : Please DO NOT display your raw python code (from the Notebook) during the presentation, unless asked for.
